**TECHNICAL OVERVIEW**

**BACKGROUND ON THE INTERNATIONAL CIVIL AVIATION ORGANIZATION AND ITS PROCESSES**

**SUMMARY**

In 2013, the International Civil Aviation Organization (ICAO), the UN body responsible for setting standards for international flights, pledged to cap aviation greenhouse gas emissions at 2020 levels, delivering “carbon neutral growth from 2020.” The industry has gone even further, committing to reduce their net carbon emissions to half of their 2005 levels by 2050 and improve fuel efficiency by 1.5 percent per year through to 2020. Even with anticipated advances in fuel efficiency and other technologies, civil aviation will need to ensure an additional 7.8 billion tonnes of carbon dioxide emission reductions between 2020 and 2040. The industry will therefore have to supplement technological and operational improvements to reduce emissions with the use of carbon offsets. In October 2016, the ICAO Assembly finalized and adopted a global market-based measure (MBM) to assist the international aviation industry in achieving its agreed targets.

The next step for the ICAO MBM is to develop guidance for applying the Emission Units Criteria, including eligible offset activities. Reducing emissions from deforestation and forest degradation, and sustainable management of forests, conservation of forest carbon stocks and enhancement of forest carbon stocks (collectively referred to as REDD+) is a framework developed under the United Nations Framework Convention on Climate Change (UNFCCC) and included in Article 5 of the Paris Agreement for addressing deforestation by helping society value forests for their carbon sequestration, storage and other services. REDD+ offers incentives to protect, restore and sustainably manage forests and their natural capital, and has almost a decade of proven results. Unlike mitigation activities in other sectors, each REDD+ credit not only avoids one metric tonne of carbon dioxide from being emitted to the atmosphere, but can also protect biodiversity, support local communities and ensure that vital ecosystem functions remain intact. These benefits are bolstered by a comprehensive set of safeguards and standards that ensure conservation and human development outcomes on the ground. The ICAO MBM can depend on REDD+ to provide the volume of robust offsets it needs to meet its emission reduction targets as well as a multitude of additional benefits in developing countries—including sustainable development, biodiversity conservation and improved human well-being—and to do so with environmental integrity.

**THE ICAO MARKET-BASED MEASURE**

In 2010, the 37th ICAO Assembly agreed on high-level principles and aspirational goals to guide the establishment of the MBM, which were further elaborated and revised by the 38th Assembly in 2013. One of the fundamental objectives of the MBM is to support the mitigation of greenhouse gas emissions from international aviation and to advance the sustainable development of the sector. The MBM aims to support the sector in reaching its mitigation targets in a realistic and cost-effective way. Therefore, it is important that the MBM ensure the fair treatment of international aviation in relation to other sectors by not imposing inappropriate economic burdens on the sector. The MBM should also promote transparency and simplicity and facilitate appropriate access to all carbon markets.

The accounting and reporting of emissions reductions are crucial for ensuring the environmental integrity of actions taken under the MBM. To prevent the duplication of emissions claimed, the guiding principles call for countries to reflect reductions achieved through MBMs in their national emissions reporting. It is imperative that emissions claimed are not accounted for more than once, as double counting or claiming would artificially inflate reported progress toward the mitigation target and compromise the achievement of the MBM’s approved objectives. Reductions claimed should also minimize leakage of greenhouse gas emissions—wherein reductions in one geography lead to an increase in another geography, resulting in fewer reductions than what is recorded.

To understand airplanes’ climate pollution, a picture is worth a thousand words. http://blogs.edf.org/climatetalks/2016/02/12/to-understand-airplanes-climate-pollution-a-picture-is-worth-a-thousand-words/?_ga=1.245391884.948298576.1454089063.
The updated MBM guiding principles in 2013 called for common but differentiated responsibilities and respective capabilities to be considered in the development of the MBM, meaning that all countries would be working toward a common goal but may contribute differently or to varying levels, depending on their respective capacities and capabilities.

For a full list of guiding principles, please see the table below, as well as ICAO’s document titled Assembly Resolutions in Force (as of 4 October 2013)

<table>
<thead>
<tr>
<th>Guiding Principles of the MBM (38th Assembly)</th>
</tr>
</thead>
<tbody>
<tr>
<td>MBMs should support sustainable development of the international aviation sector;</td>
</tr>
<tr>
<td>MBMs should support the mitigation of greenhouse gas emissions from international aviation;</td>
</tr>
<tr>
<td>MBMs should contribute towards achieving global aspirational goals;</td>
</tr>
<tr>
<td>MBMs should be transparent and administratively simple;</td>
</tr>
<tr>
<td>MBMs should be cost-effective;</td>
</tr>
<tr>
<td>MBMs should not be duplicative and international aviation CO2 emissions should be accounted for only once;</td>
</tr>
<tr>
<td>MBMs should minimize carbon leakage and market distortions;</td>
</tr>
<tr>
<td>MBMs should ensure the fair treatment of the international aviation sector in relation to other sectors;</td>
</tr>
</tbody>
</table>

**STRUCTURE OF ICAO**

The International Civil Aviation Organization (ICAO) is a United Nations (UN) body established in 1944 to manage the administration and governance of the Chicago Convention delineating guidelines and standards around international civil aviation member states are expected to follow. According to the terms of the Chicago Convention, ICAO is made up of an Assembly, a Council, and a Secretariat.

- The Assembly is composed of 191 member states, and normally meets once every three years. At this time, it reviews the work undertaken in ICAO and sets future policy as well as the budget for the subsequent three years. It is during the Assembly’s triennial meeting that the MBM, in its near-final form, would be put to a vote. The Assembly tries to make decisions by consensus, but failing this, can pass resolutions via a simple majority.
- The Council is elected by the Assembly for three-year terms and is composed of 36 member states. The Council meets several times a year, providing ongoing direction to ICAO’s work. It is responsible for adopting and incorporating Standards and Recommended Practices (SARPs) as Annexes into the Chicago Convention.

The Council is assisted in its decision-making by many technical committees comprising experts from member states as well as experts from observer organizations representing industry and civil society. Relevant to the MBM is the Committee on Aviation Environmental Protection (CAEP), established in 1983 to assist the Council in formulating new policies and SARPs related to aircraft noise and emissions and aviation environmental impact more generally. CAEP is made up of 28 member states and 10 observer organizations, including the International Coalition for Sustainable Aviation, which represents its civil society members.

In January 2014, the ICAO Council established the Global MBM Technical Task Force (GMTF) within CAEP to support the technical and analytical work around the MBM.\textsuperscript{11} It is divided into two main sub-groups:

\begin{itemize}
  \item The Emissions Units Criteria (EUC) subgroup evaluates and recommends eligibility criteria for emissions units, be it offsets and/or allowances. It also assesses the availability of emissions units to satisfy the needs of the aviation sector, and the impact this may have on carbon market supply, demand and price.
  \item The Monitoring, Reporting and Verification (MRV) subgroup makes recommendations on the requirements and procedures for MRV of global carbon emissions from international civil aviation.
  \item Additionally, the GMTF is pursuing work around emissions unit registries, looking at how to keep track of emissions units used to satisfy aviation demand.
\end{itemize}

In addition to the GMTF and its subgroups, two other groups are relevant to the functioning of the MBM.

The Alternative Fuels Task Force (AFTF) was set up in November 2013 to “evaluate the range of potential greenhouse gas emissions reductions (GHG) that could result from the use of alternative fuels in aviation to 2050” by looking at projected alternative fuel production and the life cycle emissions reductions these could provide.\textsuperscript{12} The results of the work by the AFTF could influence the magnitude of aviation’s emissions post-2020 that would need to be dealt with under the MBM.

Various policy bodies, including the Environmental Advisory Group (EAG) comprised of 17 Council Representatives and one observer organization (the International Air Transport Association, IATA); a High-Level Group (HLG) of 17 governments represented by country officers; and various other bodies including the Council itself – have been engaged in various parts of the MBM development.\textsuperscript{13}

It is important to note that the ICAO Resolution from the 39th Assembly in October 2016 requested the ICAO Council to develop recommendations for the MBM Emission Units Criteria, with technical contributions from the CAEP.

Please see the graphic below for a visual overview of the decision-making and analytical process surrounding the ICAO MBM.
